To Whom It May Concern,

VADWatch is a web-based comprehensive Remote Patient Monitoring and VAD Inventory management system that is designed to be customized for Patients to submit metrics selected by their Clinician. This is specifically for patients with a Ventricular Assist Device.
Close monitoring of Ventricular Assist Device patients is critical to prevention of acute condition changes in this patient population. VADWatch provides the platform and equipment for patients prescribed to the service to more closely monitor, trend, and alert on VAD parameters selected by their Clinician. Providers can implement early intervention based on the monitored parameters to improve the patients overall outcomes. The platform is vendor agnostic, allowing for the management of patients across the VAD spectrum allowing for standardization within the clinics remotely monitored patients regardless of the device manufacturer. This is not available on other RPM platforms. VADWatch RPM is the only VAD RPM service with proven and published hospitalization readmission reduction data. VADWatch is only available through Acelis and it is not allowed to be resold or sub-licensed by any third parties.

Best Regards,

Wendy Allen
